

## Quick-Start firmware flashing guide to C5 Hardware and OpenXC Firmware

1. Download OpenXC installation package here:  
[www.crosschasm.com/downloads/OpenXCPackage.zip](http://www.crosschasm.com/downloads/OpenXCPackage.zip)
2. Create a folder on your computer and extract the package.
3. Put the hex file that you want to flash in this new folder as well. You can find the hex files at <https://developer.ford.com/develop/openxc/>. Log in, click the Develop tab, then OpenXC from the drop-down menu. Click download under "Pre-compiled Firmware Download".
4. Copy "libusb0.dll" to c:\Windows\SysWOW64 for 64-bit Windows, or c:\Windows\system32 for 32-bit Windows
5. Copy "libusb0.sys" to c:\Windows\system32\drivers
6. Connect the C5 to your computer, the USB bootloader will run for about 5 seconds (blinking red and solid blue lights).
7. While the USB bootloader is running (first 5 seconds after power-up), use Device Manager to manually install the provided driver file "stk500v2.inf" (note that Windows 8 will indicate the file has not been signed – ignore this message).
8. Open a command prompt window and navigate to the folder that you created in step number 2.
9. Disconnect and re-connect the OpenXC device.
10. Within 5 seconds of connecting the device, run avrdude using "avrdude.exe -U flash:w:<HEX> -c stk500 -p 32MX795F512L -C avrdude.conf -P COM<n>", where <HEX> is the name of your firmware file (that you copied into the folder) and <n> is the com port number for the OpenXC device (you can use Device Manager to check this)
11. Enjoy!
